LEA: Implementation in Little-Endian

1.1 Specification

Table 1.1: Specification Comparison between AES and LEA Block Ciphers

Specification	AES	LEA
Block Size (bits)	128	128
Key Size (bits)	128/192/256	128/192/256
Structure	Substitution-Permutation Network	Generalized Feistel Network (ARX - Add-Rotation-Xor)
Rounds	10/12/14 (depends on key size)	24/28/32 (depends on key size)
Design Year	1998	2013

Table 1.2: Parameters of the Block Cipher LEA (1-word = 32-bit)

Algorithms	Block Size (N_b -byte)	Key Length (N_k -byte)	Number of Rounds (N_r)	Round-Key Length (byte)	Total Size of Round-Keys ($(N_r * 192)$ -bit)
LEA-128	16(4-word)	16(4-word)	24	24	4608 (144-word)
LEA-192	16(4-word)	24(6-word)	28	24	5376 (168-word)
LEA-256	16(4-word)	32(8-word)	32	24	6144 (192-word)

1.2 State Representation

Let $\text{state}[0], \text{state}[1], \dots$ be representation of arrays of bytes. Note that

$$\text{state}[i] := \{input_{8i}, input_{8i+1}, \dots, input_{8i+7}\} \in \mathbb{F}_{2^8}$$

for $input_i \in \mathbb{F}_2$. For example, $\text{state}[0] = \{input_0, input_1, \dots, input_7\}$.

The 128-bit plaintext P of LEA is represented as an array of four 32-bit words $P[0], P[1], P[2]$ and $P[3]$. Then

$$P[i] = \text{state}[4i + 3] \parallel \text{state}[4i + 2] \parallel \text{state}[4i + 1] \parallel \text{state}[4i] \quad \text{for } 0 \leq i \leq 3.$$

Here, $P[i] \in \mathbb{F}_{2^{32=8 \cdot 4}}$. The key K of LEA is also represented as the same way.

2.1 Padding

Block ciphers require input lengths to be a multiple of the block size. Padding is used to extend the last block of plaintext to the required length. Without proper padding, the encryption process may be insecure or infeasible.

There are several padding schemes used in practice, such as:

Table 2.2: Padding Standards in Block Ciphers

Standard Name	Padding Method
PKCS#7	Pad with bytes all the same value as the number of padding bytes ...dd dd dd dd dd dd dd dd dd dd dd dd dd 04 04 04 04
ANSI X9.23	Pad with zeros, last byte is the number of padding bytes ...dd dd dd dd dd dd dd dd dd dd dd dd dd 00 00 00 00 05
ISO/IEC 7816-4	First byte is '80' (hex), followed by zeros ...dd dd dd dd dd dd dd dd dd dd dd dd dd 80 00 00 00 00 00
ISO 10126	Pad with random bytes, last byte is the number of padding bytes ...dd dd dd dd dd dd dd dd dd dd dd dd dd 2e 49 1b c1 aa 06

2.1.1 PKCS#7

```
1 void PKCS7_PAD(u32* block, size_t block_len, size_t input_len) {

4             "Block length must be greater than input length.\n");
5         return;
6     }
7
8     u8 padding_value = block_len - input_len;
9     for (size_t i = input_len; i < block_len; ++i) {
10         block[i] = padding_value;
