## **LEA: Implementation in Little-Endian**

#### 1.1 Specification

Table 1.1: Specification Comparison between AES and LEA Block Ciphers

Specification	AES	LEA	
Block Size (bits)	128	128	
<b>Key Size (bits)</b>	128/192/256	128/192/256	
Structure	Substitution-Permutation Network	Generalized Feistel Network	
Rounds	10/12/14 (depends on key size)	24/28/32 (depends on key size)	
Design Year	1998	2013	

Table 1.2: Parameters of the Block Cipher LEA (1-word = 32-bit)

	Block	Key	Number of	Round-Key	Number of	Total Size of
Algorithms	Size	Length	Rounds	Length	Round-Keys	Round-Keys
	$(N_b$ -byte)	$(N_k$ -byte)	$(N_r)$	(byte)	$(N_r + 1)$	$(N_b(N_r+1))$
LEA-128	16(4-word)	16(4-word)	24	24	11	44 (176-byte)
LEA-192	16(4-word)	24(6-word)	28	24	13	52 (208-byte)
LEA-256	16(4-word)	32(8-word)	32	24	15	60 (240-byte)

#### 1.2 State Representation

Let state[0], state[1], ... be representation of arrays of bytes. Note that

$$state[i] := \{input_{8i}, input_{8i+1}, \dots, input_{8i+7}\} \in \mathbb{F}_{2^8}$$

for  $input_i \in \mathbb{F}_2$ . For example, state[0] =  $\{input_0, input_1, \dots, input_7\}$ .

The 128-bit plaintext P of LEA is represented as an array of four 32-bit words P[0], P[1], P[2] and P[3]. Then

$$P[i] = \text{state}[4i+3] \parallel \text{state}[4i+2] \parallel \text{state}[4i+1] \parallel \text{state}[4i] \quad \text{for} \quad 0 \le i \le 3.$$

Here,  $P[i] \in \mathbb{F}_{2^{32=8\cdot 4}}$  The key K of LEA is also represented as the same way.
